

Paper 1

Flow Organization in Ordered and Disordered Rotational Particle Arrays: Experiments and Pore-Scale Lattice Boltzmann Simulations

1. Introduction

1.1 Packed Particle Arrays and Cross-Flow Systems

1.2 Rotational and Structured Particle Arrangements

1.3 Experimental and Numerical Studies of Flow Through Particle Arrays

1.4 Knowledge Gaps

1.5 Objectives and Scope

2. Methodology

2.1 Experimental Configuration and PIV Measurements

2.2 Geometry Definition and Topology Description

2.3 Lattice Boltzmann Method

2.4 Computational Domain and Boundary Conditions

2.5 Grid Independence and Numerical Verification

2.6 Experimental–Numerical Comparison Procedure

3. Validation of the Numerical Framework

3.1 Qualitative Comparison of Velocity Fields

3.2 Layer-Wise Velocity Profile Validation

3.3 Quantitative Error Assessment

4. Flow Organization in Ordered Rotational Arrays

4.1 Mean Velocity Fields

4.2 Streamline Organization and Transport Pathways

4.3 Recirculation Regions and Flow Structures

4.4 Reynolds Number Effects on Mean Flow Organization

5. Layer-Wise Flow Development

5.1 Evolution of Velocity Profiles Through the Array

5.2 Development of Flow Structures Across Layers

5.3 Approach to Periodic Flow Behavior

6. Effect of Rotational Topology

6.1 Comparison Between 30° and 40° Configurations

6.2 Topology-Induced Redistribution of Flow

6.3 Influence of Topology on Recirculation and Transport Pathways

7. Effect of Structural Disorder

7.1 Comparison Between Ordered and Disordered Arrays

7.2 Symmetry Breaking and Flow Redistribution

7.3 Velocity Distribution Analysis

7.4 Implications of Disorder on Flow Organization

8. Discussion

8.1 Topology-Controlled Flow Organization

8.2 Ordered and Disordered Flow Behavior

8.3 Limitations and Outlook Toward Unsteady Flow Analysis

9. Conclusions
